Acknowledgements

I would like to express my thankfulness to all those who helped me accomplish this undertaking. I am particularly indebted to Dr Sazvar without whose help, I couldn't accomplish this job. I am also indebted to Dr Marandi for her careful readings and invaluable comments.

I should also thank Dr Dabir Moghadam for his insightful suggestion in the beginning of the study and Dr Faghih for his lectures which made me interested in contrastive rhetoric.

I owe further thanks to the nice staffs at libraries of Azzahra, Science and Technology, Tarbiat modarres, and teacher education universities, who helped me in the gathering of the corpus of this study.

Last but not least, I'd like to thank my family for their patience, support and encouragement during the years of my education.

Abstract

Contrastive rhetorical studies, which focus on different sections of research article abstracts, have already become an established area of inquiry. However, one of the sections of research articles, abstract, has not received due attention. Although it seems short and simple in surface, writing an abstract which meets the rhetorical demands of editorials is a demanding task even for native speakers. This study tries to explore rhetorical features of research article abstracts by exploring rhetorical variations between Iranian and international research article abstracts belonging to two academic disciplines, applied linguistics and medicine. To this end, 80 research article abstracts written in English were chosen randomly from 6 Iranian and 6 international academic journals in the two mentioned fields of study. The rhetorical moves and steps of the abstracts were analyzed following I-M-R-D move structure and Swales' (1990) CARS model, respectively. The results of statistical analysis suggested that while medical and applied linguistic abstracts differ significantly in several rhetorical features, in the number of rhetorical moves, number and type of rhetorical steps, and move length, Iranian and international research article abstracts share some rhetorical features. It can be concluded that disciplinary conventions play an important role in shaping rhetorical features of research article abstracts.

Keywords: contrastive rhetoric, research article abstracts, IMRD move structure, CARS model

CHAPTER 1

Introduction

1.1 Background

One of the most important text types in EAP (English for academic purposes) is the research article, because it has the important function of "communicating new knowledge to the other members of the academic community" (Martin, 2003, p .25). In addition, research articles published in first-rank academic journals provide most respect and reward for their writers and promote their academic standing in many academic communities (Swales, 2004).

Because of their perceived importance, research articles are becoming a growing field of study in linguistics. Most of such studies specifically focus on one of the subparts of research articles. *Abstract* is one of the subparts that has lately attracted a lot of attention, because as Ventola (1994, as cited in Lores, 2004, p. 281) mentions, its role is being recognized as "a tool of mastering and managing the ever increasing information flow in the scientific community." They are like a "gateway" that lead readers to take up an article, journals to select contributions, or organizers of conferences to accept or reject papers (ibid.).

Although short and simple in surface, as Lores (2004, p. 281) mentions, the article abstract is "a genre in its own right" and demands lots of time and endeavor, even for the native speakers, to be as summarized and
