ACKNOWLEDGEMENTS

The completion of this dissertation marks an important milestone in my life, and many people have a special part to play in bringing this about. First, I am eternally grateful to my supervisor, Dr. Mansoor Tavakoli, who has all along been an incredibly supportive mentor. He is genuine and kind. Despite his physical conditions and extremely busy schedule, he contributed valuable insights to my research as an accomplished applied linguist. It is his congenial guidance that inspired my reflection and sharpened my focus, and his unfailing encouragement that spurred me on when I seemed to run out of steam. I am truly indebted to him. Professor Tavakoli, thank you so much! Your wisdom and enthusiasm have been, and will continue to be, a great source of inspiration and support for me.

I also owe a tremendous debt to my advisor, Dr. Saeed Ketabi, and to other members serving in my dissertation committee, professor Mansoor Koosha, professor Seyyed Mohammad Alavi, professor Abbas Eslami Rasekh, and professor Azizallah Dabbaghi for their suggestions of avenues and methods for investigation, for reading and commenting on drafts of this dissertation, for offering me kind words of encouragement, and for serving as exemplary role models for how to conduct thoughtful research, in a spirit of collegiality, and helped toward improving the lot of humanity. Thank you all for helping me to arrive at this moment and for encouraging me to apply my energy toward projects that may benefit others.

I would also like to thank all my friends and colleagues who have provided me with tremendous intellectual and emotional support from the outset of this project. I would especially thank my long lasting friend, elder brother, and

colleague, Mahmood, who is also a PhD TEFL student at Isfahan University, for being there and for making himself available whenever I needed him. Thank you for taking the time out of your busy schedules to provide your thoughts and comments to demystify the research process.

Acknowledgement must also be made to all the students, teachers, and friends who volunteered their time and energy to participate in this study and help with the experiment. Without their unfailing support and contribution, this project will not be possible.

Warmest acknowledgements are due to Mr. Reza Saffariha and Mrs. Jafarzadeh, secretary of English Language Department at Mofid University, for providing me expert assistance in statistical analyses and computer related issues respectively.

My acknowledgements will not be complete without including my family. I am extremely grateful to my parents, brothers, and sisters for their love and understanding and for always giving me a free hand to pursue and fulfill my own aspiration. My eternal thanks go to my wonderful wife, KOBRA, who let me pursue my own dream, encouraged me with her foresight and sense of humor during the hard times. I would never get to this point without the sacrifice she has made for me. Her friendship and patience has kept me going through this challenging process. I am also blessed to have a lovely daughter, **DORSA**, who is always a great joy for me.

Dedicated to
the passions of my parents and
companionship of my wife and
lovely daughter
&
Those who care

Abstract

This study aims to investigate how the acquisition of a verb's collocational features is influenced by different levels of attention and whether the effect of attention is mediated by collocational complexity and proficiency level. Four levels of attention were studied: (1) *semantic processing*: learners were only asked to understand passages with the target collocations embedded; (2) *memorization for recall*: learners were instructed to memorize the target collocations in the passages for a later recall test; (3) *rule given*: learners were provided with the target collocational rules and studied how the rules applied to the instances in the passages; (4) *rule given plus negative evidence*: learners were provided with the target rules and studied how they applied to the instances in the passages; moreover, they were informed of what were impossible noun collocates for the target verbs.

A number of 100 Persian speakers of non-English majors enrolled in Basic English and General English courses (representing two different proficiency levels) in Mofid University in Iran participated in the research. The target learning items were four partially artificial English verbs, which displayed two degrees of collocational complexity.

Within each proficiency level, participants were randomly assigned to one of the four attentional conditions as specified above and received a three-day treatment. On the fourth day, all the participants were given a test that consisted of three parts: (1) determining the basic meaning of the target verbs; (2) writing down as many

noun collocates as possible for the target verbs; (3) judging whether a sentence containing one of the target verbs was good or not.

The results indicated that, overall, learners in the two rule-oriented conditions excelled in various parts of the test: recall of phrases that appeared in the passages, production of new collocates for the target verbs, and judgment of bad collocations. Learners under the *memorization for recall* condition demonstrated certain advantages in storing old phrases, but not in other areas. The *semantic processing* condition turned out to be the least efficient for learning L2 collocations. Moreover, it was found that negative evidence in L2 collocations could help to reduce overgeneralization errors. This study did not detect an interaction between attention and collocational complexity, but an interaction between attention and proficiency level did emerge. The *memorization for recall* and *rule given plus negative evidence* conditions were less effective with Level 2 learners than with Level 4 learners. And this differential effect of attention was accounted for in terms of learners' processing features and capacity. The findings and results of this study can have several implications for syllabus designers, language teachers, and language test designers.

Key Words: Attention, awareness, collocation acquisition, collocational pattern, complexity, language proficiency, noticing hypothesis
