

IN THE NAME OF GOD

**APPLICATION OF COUPLED FINITE BOUNDARY ELEMENTS
METHOD IN INVERSE HEAT CONDUCTION AND
SOLIDIFICATION PROBLEMS**

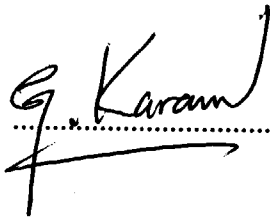

BY
MOHAMMAD RAHIM HEMATIYAN

THESIS

SUBMITTED TO THE SCHOOL OF GRADUATE STUDIES IN
PARTIAL FULFILMENT OF THE REQUIREMENTS FOR THE
DEGREE OF DOCTOR OF PHILOSOPHY (Ph.D.)

IN
MECHANICAL ENGINEERING
SHIRAZ UNIVERSITY
SHIRAZ, IRAN

EVALUATED AND APPROVED BY THE THESIS COMMITTEE
AS: EXCELLENT

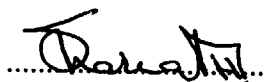

G. KARAMI, Ph.D., PROFESSOR OF
MECHANICAL ENGINEERING (CHAIRMAN)

M. YAGHOUBI, Ph.D., PROFESSOR OF
MECHANICAL ENGINEERING

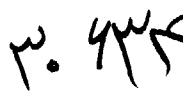

H. EMDAD, Ph.D., ASSISTANT PROFESSOR
OF MECHANICAL ENGINEERING

M. H. SHARIAT, Ph.D., PROFESSOR OF
MATERIALS SCIENCE AND ENGINEERING

JUNE 2000

To my mother for her preying for me,
and to my wife for her patience and forbearance

M. G. M. R.

Acknowledgement

I would like to express my sincere appreciation to Professor G. Karami for his invaluable encouragement through all steps of this study. Without his advice, the completion of this work would have been impossible. I also wish to thank Professors Yaghoubi, Emdad and Shariat, the members of the thesis committee and Professor Eslami, the external examiner for his valuable discussions for the completion of this work.

I would also like to extend my gratitude to my teachers in the mechanical engineering department and all the staff and my friends in the School of Engineering.

Finally I wish to acknowledge the teachers and the staff of Tohid high school in Shiraz who taught me the fundamental principles of mathematics, physics and engineering through the years 1984 to 1988.

Abstract

Application of Coupled Finite Boundary Elements Method in Inverse Heat Conduction and Solidification Problems

By

Mohammad Rahim Hematiyan

The solution to direct problems in engineering analysis has been studied by numerous researchers in various fields. In this respect different methods have been implemented. On the other hand, in comparison, the solution to inverse problems has been investigated only by a limited number of engineers or scientists.

In direct problems, geometrical domain, boundary conditions and domain loading are prescribed. The problem is solved to find one or several unknown variables within the domain or on the boundary. In inverse problems a boundary condition or a domain loading is unknown and by using some additional information within the domain or on the boundary, these unknowns are to be sought.

At first, it seems that by a rearrangement of unknowns and by a simple modification in direct formulations one can solve any inverse problem. The solutions obtained by such treatments are always severely oscillatory and

most of the time unacceptable. Therefore, some regularization methods must be employed to reduce the oscillations in the solution.

In this dissertation, various kinds of inverse problems in steady-state and transient heat conduction and solidification analysis are defined and solved. In the field of heat conduction, most of researchers have studied the inverse problems to find unknowns only on the boundary. However, in this work, new types of inverse problems which include the unknown intensity of the domain loading are studied.

The boundary element method for its clear advantages in such problems is used as the numerical method to formulate the problem. Coupled finite-boundary elements method is also used in some cases. Special mathematical treatments are implemented to evaluate the boundary integrals encountered in such problems. Also domain integrals are exactly transformed to the boundary to be evaluated with no need for domain discretization.

In the steady-state heat conduction, two categories of inverse problems have been defined. In the first category, the location and the orientation of heat sources are prescribed and intensity of sources are to be found by some additional information within the domain or on the boundary. In this respect a regularization algorithm based on the least squares method is used. In the second category of steady-state inverse problems the intensities of sources (point or line heat sources) are known and their locations and orientations must be found in a way that some desired conditions be satisfied. To solve this class of inverse problems a simple search method called "A Good Neighbor" has been devised.

In the transient heat conduction, similar to some cases in the steady-state heat conduction, inverse problems to find intensity of heat sources are studied. When only a few number of heat sources exist, a whole-domain regularization is employed and in cases where a large number of sources are considered and/or material properties are temperature-dependent and/or heat sources have movement, a sequential regularization is used. A secondary regularization algorithm is also presented and employed for better smoothing of solutions.

To solve inverse solidification problems a new method is presented in which the latent heat effects are implemented by introducing a pseudo heat source near the moving interface. In cases where material properties can be assumed constant, a boundary element formulation without domain discretization is used and in cases where material properties are temperature-dependent a coupled finite-boundary element formulation is employed. To reduce the oscillations in the solution of inverse solidification problems, sequential and secondary regularization algorithms are also used. In each case several examples are presented to assess the accuracy of methods and algorithms. In respect to steady-state heat conduction the following inverse problems are presented:

- determination of heat intensity of three point sources
- determination of heat intensity of two line sources
- determination of location of one point heat source
- determination of location of two point heat sources
- determination of location and orientation of a line heat source

In the case of transient heat conduction analysis several inverse examples are also presented and solved which are entitled as:

- determination of time-dependent intensity of one heat source
- determination of intensity of heat sources in an electrical part
- determination of time-dependent intensities of three heat sources
- determination of time-dependent intensity of a moving heat source

Two other examples for inverse solidification analysis are also presented which are:

- an inverse solidification problem in a corner region
- an inverse solidification problem with temperature-dependent thermal conductivity

The obtained results show that the presented methods and algorithms are relatively accurate, stable and efficient.

Table of Contents

Content	Page
List of Tables	xv
List of Figures	xvii
Abbreviations	xxiii
Chapter 1 Introduction	1
1-1 Contributions of dissertation	2
1-2 Scope of dissertation	3
Chapter 2 Governing Equations of Heat Conduction and Solidification Problems	7
2-1 Governing equations of heat conduction	7
2-2 Initial and boundary conditions	8
2-3 Various kinds of heat sources	10
2-4 Kirchhoff transformation	12
2-5 Solidification	15
2-5.1 Governing differential equations of solidification	16
2-5.2 Dimensionless parameters	19

Chapter 3 An Improved Boundary Element Analysis of Steady-	
State Heat Conduction Problems	21
3-1 Introduction	21
3-2 Integral equation of steady-state heat conduction	24
3-3 Some basic integrals	27
3-4 Analytical evaluation of $\int_{\Gamma} U \frac{\partial U^*}{\partial n} d\Gamma$	28
3-5 Analytical evaluation of $\int_{\Gamma} U^* \frac{\partial U}{\partial n} d\Gamma$	29
3-6 Evaluation of distributed heat source integral by exact transformation to the boundary	31
3-7 Analytical implementation of point heat sources	34
3-8 Analytical implementation of line heat sources	34
3-9 Matrix formulations	36

Chapter 4 An Improved Boundary Element Analysis of Transient	
Heat Conduction Problems	39
4-1 Introduction	39
4-2 Integral equation of transient heat conduction	40
4-3 Transformation of distributed heat source integral to the boundary	43
4-4 Implementation of point heat sources	44
4-5 Numerical implementation	45

Chapter 5 A Review of Finite Element Formulation of Heat

Conduction Problems	50
5-1 Introduction	50
5-2 Finite element formulation of steady-state heat conduction problems	50
5-3 Matrix formulation	54
5-3.1 Computation of matrices \mathbf{K}_x^e and \mathbf{K}_y^e	55
5-3.2 Computation of \mathbf{K}_{cv}^e and \mathbf{F}_{cv}^e	56
5-3.3 Computation of \mathbf{F}_s^e	57
5-3.4 Computation of \mathbf{F}_g^e	57
5-4 Resulted system of equations	58
5-5 Finite element formulation of transient heat conduction problem	59
5-6 Lumped versus consistent capacitance matrix	60
5-7 Solutions methods of transient system of equations	63
5-7.1 Forward difference scheme	63
5-7.2 Backward difference scheme	65
5-7.3 Crank-Nicolson scheme	66
5-7.4 Summary of difference schemes	67

Chapter 6 Coupling of Finite Elements and Boundary Elements

Methods	68
6-1 Introduction	68
6-2 Direct coupling theory	72

6-3 Symmetrizing the system of equations generated in BEM . . .	75
6-4 An energy approach for symmetric boundary element formulation	76
6-5 Non-symmetric coupling of FEM and BEM in steady-state heat conduction analysis	80
6-6 Non-symmetric coupling of FEM and BEM in transient heat conduction analysis	83

Chapter 7 Inverse Analysis of Steady-State Heat Conduction

Problems with Heat Sources	86
7-1 Introduction	86
7-2 Inverse determination of intensity of heat sources	90
7-3 Singular value decomposition and pseudo-inversion	93
7-4 Inverse determination of location and orientation of point and line heat sources: A Good Neighbor Method	95

Chapter 8 Inverse Analysis of Transient Heat Conduction

Problems with Heat Sources	99
8-1 Introduction	99
8-2 Rearrangement of equations	102
8-3 Whole-domain regularization	103
8-4 Sequential regularization using future temperature information	110
8-5 Selection of regularization parameters	112
8-6 Secondary regularization	114

Chapter 9 Inverse Analysis of Solidification Problems Using	
Pseudo Heat Source Method	116
9-1 Introduction	116
9-2 Inverse solidification problem	121
9-3 A finite-boundary element formulation of transient heat conduction with temperature dependent material properties	126
9-4 Selection of the regularization parameters in inverse analysis of solidification problems	133
 Chapter 10 Numerical Examples of Direct Analysis	135
10-1 Introduction	135
10-2 A comparison of analytical with numerical integration ...	136
10-3 A point heat source in a two-dimensional steady-state heat conduction problem	138
10-4 A line heat source in a two-dimensional steady-state heat conduction problem	140
10-5 A nonlinear problem with distributed heat sources	142
10-6 Uniform heat source in a steady-state heat conduction problem with multiply-connected domain	146
10-7 A three-dimensional steady-state heat conduction problem with a line heat source	148

10-8 A three-dimensional steady-state heat conduction problem with distributed heat source	149
10-9 Transient analysis of a problem with non-uniform time- independent heat source	152
10-10 Transient analysis of a problem with non-uniform time- dependent heat source	154
Chapter 11 Numerical Examples of Inverse Analysis	156
11-1 Introduction	156
11-2 Determination of heat intensity of point sources	157
11-3 Determination of heat intensity of line sources	162
11-4 Determination of the location of a point heat source	164
11-5 Determination of locations of two point heat sources	167
11-6 Determination of location and orientation of a line heat source	169
11-7 An inverse transient heat conduction problem with one heat source and one sampling point	171
11-8 An electrical part with heat sources	175
11-9 An inverse transient heat conduction problem with three heat sources and five sampling points	180
11-10 An inverse moving heat source problem	191
11-11 An inverse solidification problem in a corner region	201
11-12 An inverse solidification problem with temperature- dependent thermal conductivity	208

Chapter 12 Conclusions and Recommendations	214
Appendix A Analytical Evaluation of Basic Integrals	217
Appendix B Accurate Implementation of Heat Sources in 3D	221
Appendix C Dual Reciprocity Method (DRM)	224
Appendix D Multiple Reciprocity Method (MRM)	227
References	231
