Acknowledgements

I am grateful to those great people who inspired me and encouraged me to pursue this goal. First, I would like to express my heartfelt gratitude to my supervisor, Dr. Saeed Ketabi, who has been an incredible mentor and teacher. I always appreciate his effort toward ensuring that my PhD was not only a degree to be proud of but a continual process of inquiry. Thank you for unwavering support, ongoing recommendations and graceful inspiration you provided for me during my PhD program. I am also deeply indebted to my advisor and my consummate mentor, Dr Mansoor Tavakoli, for his sharp insights, tireless efforts, and encouragement. I am forever appreciative for the considerable part you played in this study.

I would like to acknowledge the generous cooperation of the Language Center at the University of Isfahan. I thank each and everyone who had a role in my accomplishment.

I wish to particularly acknowledge Iran Ministry of Science, Education and Technology which provided me with financial support for my PhD sabbatical leave in the Netherlands.

Finally, I would like to extend my sincere thank to my family for giving me their unconditional love, care and patience.

Dedication

This effort is dedicated to my late Quran teacher

Abstract

Given the increasing public demands for preparation courses, the purpose of this study was to explore how high-stakes testing influenced the nature and process of preparation courses as well as teachers' instructional decisions and professionalism. It also raised challenging questions regarding the teacher's reactions to tests' pressures and the factors involved in variations of responses. To achieve this end, concepts from Structuration Theory and Washback Hypothesis were employed to capture the complex and dynamic interaction between tests and teachers. The study was conducted at the Isfahan University Language Center (IULC) in Iran. It dealt with the performance of four instructors selected through convenient sampling at preparation courses of high-stake tests, two in the IELTS and two in TOEFL PBT.

This interpretive study was conducted in three phases. A mixed method was used for obtaining both quantitative and qualitative data. Phase one, an ethnographic case study, involved using observation and field notes to gather data about how high-stakes testing affected teachers' curriculum and methodology treatment. Part A of COLT and UCOS were used as observation schemes to collect in-depth and in-situ data. The second phase aimed at eliciting the effects of the tests on teachers' feelings, attitude and perceptions. A questionnaire survey was used to collect relevant data. To capture an accurate meaning of the teachers' professional decisions and practice, field notes and an interview were also conducted. Grounded Theory method was used for inductively analyzing data from interview and field notes. The constant comparison method and coding system, open, axial and selective, aided in uncovering the themes grounded in the data. Four themes, personality, professional, academic and strategic compromise, with several subthemes emerged revealing the factors related to teachers which could be influential for bringing about positive and negative washback. Cumulatively, the themes indicated high-stakes testing placed teachers in the dilemma position of pedagogical and ethical challenges to set a balance between tests' mandates and teachers' authority.

One theme, Strategic Compromise, related specifically to teachers' professional responses to the mandates of tests. Strategic compromise seemed more like a continuum accounting for the varying reactions of the teachers to the compliance of the same test, which went beyond the simple dichotomy of "blind adherence" or "ignorance".

SCR: Strategic Compromise Repertoire

ST: Structuration Theory

TOEFL: Test of English as a Foreign Language

TQ: Teacher Questionnaire

UCOS: University of Cambridge Observational Scheme

Chapter One

Introduction

1.1. Overview

Language testing has long been considered as a binding theme between two influential domains of applied linguistics: teaching and learning. In education, tests are used for several purposes: entrance, diagnostic, admission, placement, achievement, proficiency, etc. Thus, tests have the power to select, reward, motivate and at the same time they can exclude, punish and de-motivate (Hayes, 2003, p.1). One of the most important uses of language tests is as a gate-keeper: whether to allow individuals to enter into a program or not. Considering the mobility of knowledge/skill and the increasing interest in studying abroad and migration, there has been a growing demand for proficiency tests which are mostly used as gate-keepers, especially for admission into higher-education.

Two of these popular tests which are used internationally to provide language proficiency benchmarks for the admission into universities are the International English Language Testing System (IELTS) and Test of English as a Foreign Language (TOEFL). These tests are considered to be quite high-stake. High-stake tests refer to those tests whose results are used to make important decision regarding test-takers. It is argued that these tests, with their associated consequences, exert influence, either desirable or undesirable, over teaching and learning, a phenomenon which is frequently referred to as "washback", which receives an increasing attention from test developers, researchers, educators, material developers, administrators, teachers etc. The term washback or 'backwash' as it is sometimes referred to, can be generally defined as the effect of testing on teaching and learning, both positive and negative, and is therefore a form of impact (Alderson and Wall, 1993; Biggs, 1995).

High-stakes testing and accountability provoke numerous reactions. Opponents of the focus on testing and accountability believe it has been deleterious to teaching and learning (Popham, 2001). Some charge that teachers teach to the test, spend excessive class time on test preparation exercises, and place too much emphasis on standardized testing (Barksdale-Ladd & Thomas, 2000). In contrast, other research points to the beneficial outcomes of testing, such as improved professional development and increased student-centered pedagogies and achievement (Au, 2007; Cizek, 2001).

However, it should be noted that some studies indicate that washback is an extremely complex and elusive phenomenon (Alderson & Wall 2003; Cheng 2005). While the relationship between exams and washback is sometimes thought of as a simple one in which exams generate a direct, automatic and blanket washback, it seems that other factors beside the exam itself play their part in determining washback. Washback is a phenomenon that does not exist automatically in its own right but is rather one that can be brought into existence
