DECLARATION

Hereby, Mohammad Abbasi (832781) student of Organic Chemistry College of Sciences certify that this thesis results from my own research and whenever I have utilized other sources, I have clearly reference them. I also declare that the research and the title of my thesis are novel and I promise, without the permission from the university, the results never be published or bring to someone else. The copyright of this thesis is the property of Shiraz University.

THESIS

SUBMITTED TO THE SCHOOL OF GRADUATE STUDIES IN
PARTIAL FULLFILMENT OF THE REQUIREMENT FOR THE
DEGREE OF DOCTER OF PHILOSOPHY (Ph.D.)

IN

ORGANIC CHEMISTRY
SHIRAZ UNIVERSITY
SHIRAZ, I. R. IRAN

EVALUTED AND APPROVED BY THESIS COMMITTEE AS: EXCELLENT

 H. Firouzabadi, Ph.D., Prof. of Chemistry (Chairman)
 N. Iranpoor, Ph.D., Prof. of Chemistry
 A. A. Jarrahpour, Ph.D., Assoc. Prof. of Chemistry
 P. Salehi, Ph.D., Prof. of Chemistry (Shahid Beheshti University)

JULY 2009

Dedicated to:

My Family Specially My Dear Son,

Ali Reza

On the Occasion of His 4th Birthday

And

My Teachers

Prof. Habib Firouzabadi & Prof. Nasser Iranpoor

ACKNOWLEDGEMENTS

I would like to express my deepest gratitude to my advisor, Professor H. Firouzabadi, for his support and helpful guidance throughout the research. His continued support led me to the right way.

I gratefully thank to Prof N. Iranpoor for his valuable comments and constant supports through out my education.

I would also like to extend my appreciation to my committee members: Prof. Peyman Salehi and Dr. Ali Asghar Jarrahpour for reviewing and revising of the thesis.

I am also thankful to Prof. Firouzabadi and Prof. Iranpoor's research group and all my friends, especially Dr. Reza Khalifeh, Dariush Khalili and Maarof Zarei for their sincerity and cooperation. I am also indebted to my dear friend, Dr. Abdol Hamid Fadavi, for technical assistance.

I am particularly indebted to Persian Gulf University for giving me this good opportunity to study in Ph.D. course.

Finally, I want to special thank my family for their love, encouragement, and advice.

ABSTRACT

New approaches to C-S bond formation using thiolic and non-thiolic precursors

BY:

Mohammad Abbasi

In this thesis we have introduced two odorless, one-pot methods for preparing thia-Michael adducts from non-thiolic precursors. In one procedure, thia-Michael adducts are prepared from alkyl halides, thiourea and Michael acceptors in SDS micellar media. In this method, α,β -unsaturated ketones, esters, nitriles and amides successfully produced the corresponding thia-Michael adducts in good to excellent yields.

In the second method, polyethylene glycol (PEG 200) is employed as another green media for direct preparation of thia-Michael adducts from non-thiolic precursors under mild conditions. In this protocol, a mixture of an alkyl halide (primary, secondary, tertiary, allylic or benzylic), thiourea, a conjugated olefin (ketones, esters, nitriles) and sodium carbonate in wet PEG 200 cleanly produced the related thia-Michael adducts in good to excellent yields.

We have also developed two odorless methods for the preparation of disulfides from non-thiolic precursors. In the first, disulfides are produced in SDS micellar media from their corresponding primary, benzylic or allylic halides using thiourea, MnO_2 and a base (NaHCO_3 or Na_2CO_3) in good to excellent yields. By the second method, wet PEG 200 is used as a media for direct conversion of alkyl halides to disulfides. In this method, primary, secondary, tertiary, allylic, and benzylic halides were efficiently converted to their corresponding symmetrical disulfides by the use of thiourea, MnO_2 and Na_2CO_3 in high yields at 30-35 °C.

In addition, a catalyst-free procedure for large-scale addition of thioacids to a variety of electron-deficient olefins under solvent-free conditions at room temperature is also developed.

We have also developed two new mild procedures for regioselective addition of thioacids to epoxides in the presence of silica gel. In the first method, thioacids are added to epoxides in the presence of small portions of silica gel under solvent-free conditions to produce the corresponding β -hydroxy thioesters in good to excellent yields. However, it has been found that the resulted β -hydroxy thioesters in treatment with silica gel were partially rearranged to their corresponding β -mercapto ester isomers *via* an acyl transfer process. Accordingly, we have developed another method for one-pot and selective preparation of β -mercapto esters from the reaction of thioacids with epoxides in the presence of silica gel.

CHAPTER TWO: EXPERIMENTAL	44
2.1. General	45
2.2. General procedure for the synthesis of thia-Michael adducts using alkyl halides, thiourea and electron deficient alkenes in micellar solution of SDS at 80-90 °C	45
2.2.1. Typical procedure for the synthesis of 3-(decylthio)cyclohexanone using 1-iododecane, thiourea and 2-cyclohexenone in SDS micellar solution at 80-90 °C	46
2.2.2. Typical procedure for large-scale preparation of butyl 3-(butylthio)propanoate using <i>n</i> -butyl acrylate, thiourea, <i>n</i> -butyl bromide and NaHCO ₃ in SDS micellar solution	46
2.3 General procedure for the synthesis of thia-Michael adducts with allylic and benzylic halides, thiourea and electron deficient alkenes in micellar solution of SDS at room temperature	47
2.3.1. Typical procedure for synthesis of butyl 3-(benzylthio)propanoate using benzyl chloride, thiourea and <i>n</i> -butyl acrylate in micellar solution of SDS at room temperature	47
2.4. General procedure for thia-Michael addition to acrylamide in micellar solution of SDS using alkyl halides, thiourea and Na ₂ CO ₃ at 80-90 °C	48

2.4.1. Typical procedure for synthesis of 2-(benzylthio)acetamide using acrylamide, benzyl bromide, thiourea and Na ₂ CO ₃ in SDS micellar solution at 80-90 °C	48
2.5. General procedure for one-pot preparation of thia-Michael adducts using alkyl halides, thiourea, electron-deficient alkenes, and sodium carbonate in wet PEG 200 at 30-35 °C	49
2.5.1. Typical large-scale procedure for one-pot preparation of butyl 3-(octylthio)propanoate using 1-bromooctane, thiourea, <i>n</i> -butyl acrylate, and sodium carbonate in wet PEG 200 at 30-35 °C	49
2.6. General procedure for one-pot preparation of disulfides using alkyl halides, thiourea and MnO ₂ in the micellar solution of SDS at 80 °C	67
2.6.1. Typical procedure for large-scale preparation of dibutyl disulfide using <i>n</i> -butyl bromide, thiourea and MnO ₂ in SDS micellar solution at 80 °C	67
2.7. General procedure for one-pot preparation of benzylic or allylic disulfides using benzylic or allylic halides, thiourea and MnO ₂ in SDS micellar solution at room temperature	68
2.7.1. Typical procedure for one-pot preparation of dibenzyl disulfide using benzyl chloride, thiourea and MnO ₂ in SDS micellar solution at room temperature	68
2.8. General procedure for one-pot conversion of alkyl halides to their corresponding symmetrical disulfides using thiourea and MnO ₂ in wet polyethylene glycol (PEG 200) at 30-35 °C	69
2.8.1. Typical scale-up procedure for direct conversion of benzyl chloride to its corresponding symmetrical disulfides	

using thiourea and MnO ₂ in wet polyethylene glycol (PEG 200) at 30-35 °C	69
2.9. General procedure for catalyst-free conjugate addition of thioacids to electron-deficient olefins under solvent-free condition at room temperature	71
2.9.1. Typical large-scale procedure for the conjugate addition of thioacetic acid to <i>n</i> -butyl acrylate	72
2.9.2. Typical large-scale procedure for the conjugate addition of thiobenzoic acid to benzylideneacetone	72
2.10. General procedure for one-pot preparation of β -trimethylsilyloxy thioesters <i>via</i> regioselective ring opening of epoxides with thioacids at room temperature in the absence of solvent	79
2.10.1 Typical procedure for one-pot preparation of S-3-phenoxy-2-(trimethylsilyloxy)propyl ethanethioate <i>via</i> regioselective ring opening of 2-(phenoxymethyl)oxirane with thioacetic acid at room temperature in the absence of solvent	80
2.11. General procedure for one-pot synthesis of β -mercapto esters from thioacids and epoxides in the presence of SiO ₂	80
2.11.1. Typical procedure for one-pot synthesis of β -mercapto esters from thioacids and epoxides in the presence of SiO ₂	81
2.12. General procedure for the protection of –SH functional group in the β -mercapto esters using benzyl bromide and Et ₃ N in water	81
2.12.1. Typical procedure for the protection of –SH	

functional group in the 1-mercapto-3-phenoxypropan-2-yl acetate using benzyl bromide and Et ₃ N in water	82
CHAPTER THREE: RESULTS AND DISCUSSION	92
3.1. A facile generation of C-S bonds <i>via</i> one-pot, odorless and efficient thia-Michael addition reactions using alkyl halides, thiourea and electron-deficient alkenes in the micellar solution of sodium dodecyl sulfate (SDS)	93
3.2. A facile generation of C-S bonds <i>via</i> one-pot, odorless and efficient thia-Michael addition reactions using alkyl halides, thiourea and electron-deficient alkenes in wet polyethylene glycol (PEG 200)	109
3.3. A facile generation of disulfides in one-pot, odorless and efficient method using alkyl halides, thiourea and MnO ₂ in the micellar solution of sodium dodecyl sulfate (SDS)	117
3.4. A one-pot, efficient, and odorless method for synthesis of symmetrical disulfides from organic halides, and thiourea in the presence of MnO ₂ and Na ₂ CO ₃ in wet polyethylene glycol (PEG 200)	125
3.5. Catalyst-free C-S bond formation <i>via</i> thia-Michael addition of thioacids to electron-deficient olefins in the absence of solvent at room temperature	129
3.6. Regioselective ring opening of epoxides with thioacids catalyzed by silica gel	134
3.7. Conclusions	141

CHAPTER ONE
INTRODUCTION AND LITERATURE REVIEW

CHAPTER ONE

INTRODUCTION AND LITERATURE REVIEW

1.1. Introduction

Organosulfur compounds are molecules which contain at least one sulfur atom in their molecular structures and are found extensively in nature. Fossil fuels, coal, petroleum, and natural gas, which are derived from ancient organisms, necessarily contain organosulfur compounds. Sulfur-containing molecules can be found in all living organisms (such as: biotin, ligands in bio-inorganic complexes and amino acids) which play important roles in catabolism and anabolism reactions. Thus, they are essential part of life. These compounds have found wide applications in agriculture, medicine, and industry as insecticide, fungicide, emulsifier, and etc.

Important organosulfur compounds can be classified in several groups, including thiols (mercaptans), sulfides (thioethers), sulfoxides, sulfones, thioesters, thioacids, sulfonic and sulfinic acids and their derivatives and also disulfides (Scheme 1.1).

Scheme 1.1

Synthetically, carbon-sulfur bond formation is the essence of organic sulfur synthesis and provides the foundation of generating more complicated organo-sulfur compounds from simpler molecules such as thiols.¹

1.2. Thiols

Thiols are among the simplest classes of the organosulfur compounds playing important part in many chemical transformations. This is primarily due to the presence of a sulfur atom, a reactive center of variable valency, and also the S-H bond whose rupture can result in generation of thiyl radicals, thiolate anions, and sulfenyl cations operating as relatively stable and highly reactive intermediates. Thiols also play important role in many biochemical processes. For instance, cysteine is a component of proteins that operate in the biochemical redox processes and in the capture of free radicals.² The presence of this amino acid rest ensures formation of disulfide bridges fixing the conformation of proteins and polypeptides by building up a cystine fragment. The cystamine enters into disulfide exchange with the newly synthesized proteins containing thiol groups.³ Glutathione tripeptide with a thiol group is present in a relatively high concentration in the intercellular space of the living organisms.⁴ It preserves the thiol groups in proteins, destroys peroxides and free radicals, and performs the coenzyme function. Glutathione espermidine takes part in the growth control and in metabolism of nucleic acids.⁵ The coenzyme A (COA-SH) containing an active mercapto group catalyzes acyl groups transfer in the biosynthesis of fatty acids and biotin.⁶ Certain dithiols, in particular, dihydrolipoic acid, take part in the photosynthesis and the metabolism in mitochondria.^{7,8} The conversion of the green form of sulfomyoglobin into the red form is believed⁹ to result from transformation of a thioepoxy group into a thiol one. The natural occurrence of thiols is relatively rare due to their ready oxidation to disulfides. Thiols naturally form mostly as
