DECLARATION

I hereby declare that the present thesis is a presentation of my original research work. I also declare that I have fully cited and referenced all material and results that are not original to this work.

Malihe Salami

October, 2014

To My Mother

With All My Affection

ACKNOWLEDGMENTS

I would like to express my deepest gratitude to all the people who contributed in some way to the work described in this thesis.

First of all, I acknowledge my indebtedness to my supervisor, **Dr. Mohammad Raouf Moini**, for his guidance and assistance with this study. His constructive feedback and insightful comments helped me enormously to improve my project. I am also grateful to **Dr. Mohammad Reza Shams**, my advisor, for providing me with useful resources.

I would like to thank my referee, **Dr. Abbas Zare-ee**, for his helpful comments.

I would also like to thank my brother, Hadi, from the bottom of my heart for his invaluable guidance, support and insight throughout my MA research studies. I am greatly indebted for his valuable contributions and tremendously helpful suggestions he has made.

Finally and most importantly, my undying gratitude goes to my family for their infinite patience and unflagging support.

ABSTRACT

Over the past decade, there has been an increasing interest in the study of interactional metadiscourse markers in different contexts. However, no study has been ever reported to examine the use of interactional metadiscourse in journal author guidelines. Therefore, this corpus-based study had three main aims: 1) to delve deep into the types, frequencies and functions of stance and engagement markers based on Fu's (2012) interactional metadiscourse taxonomy, 2) to compare the distribution of stance and engagement features in journal author guidelines and 3) to investigate whether there is a significant difference between macro/micro interactional metadiscourse markers in journal author guidelines. A corpus of 280 author guidelines produced by seven leading international academic publishers in eight academic sub-disciplines in the humanities and social sciences was compiled and analyzed. The results of the analysis showed that engagement features (reader-oriented) enjoyed higher frequency of use in journal author guidelines. Also, the difference between the frequency of stance and engagement features was statistically significant. Furthermore, differences reported between macro and micro interactional metadiscourse were statistically significant. The extensive use of macro interactional metadiscourse markers indicated a high degree of interactionality of journal author guidelines. The present study gives us considerable insight into the dialogic nature of a totally neglected academic genre.

Keywords: Interactional Metadiscourse, Stance, Engagement, Journal author guideline, Macro-interactional metadiscourse, Micro-interactional metadiscourse

CHAPTER ONE

INTRODUCTION

1.1 Overview

In this chapter, background to the study is discussed by focusing on the use of interactional metadiscourse in "journal author guideline" as a particular academic genre. Following this section, we will spark the discussion about the problem to outline the basic facts of the problem and explain why the problem matters. Then, the significance of the study is presented by focusing on how this study can help the editors of the journals express their ideas, position themselves appropriately and engage readers through addressing readers' expectations. Finally, research questions are stated and following them the definitions of key terms are given.

1.2 Background of the Study

According to Widdowson (1984), "academic genres, like other forms of writing, require writers to consider the expected audience and anticipate their background knowledge, processing problems, and reaction to the text" (p. 220). On the other hand, readers try "to predict lines of thought, interrogate author on their positions, and evaluate work for its usefulness and importance to their own research" (Hyland, 1994, p. 239).

Over the last decade it has been acknowledged that the skill of effective writing involves developing an awareness of the audience or what Kroll (1984, cited in Ansarin & Tarlani-Aliabdi, 2011, p. 154) calls 'imagining a second voice' and the

ability to exploit that awareness during writing a text (Grabe & Kaplan, 2000). In other words, writer-reader interaction is achieved given that the reader's interests, expectations, knowledge and anticipations are taken into account in a way a text is written. In terms of second voice analysis, according to Kroll, there are three perspectives on audience: 1) rhetorical perspective which considers the act of writing as 'persuasive in intent', 2) informational perspective which sees the act of writing as a 'process of conveying information' and 3) social perspective which views writing as an act of communication that involves the processes of inferring the thoughts and feelings of other persons included. What is entailed in this classification is the audience awareness of style and rhetoric.

The explication of such a reader-writer interaction in the process of academic writing is based on Halliday's (1978, 1985) classification of three macro-functions of language: ideational, interpersonal and textual. Interpersonal function is achieved through metadiscourse (MD) that builds a textual interaction between the reader and the writer.

As stated by Millan (2008), MD is a way of understanding how academic writers construct a discourse along with the anticipation of the readers' knowledge, interests and expectations, and project themselves into the text to manage interaction with the readers and influence their reactions. Therefore, the interaction between writer and reader is influenced not only by the writer's purpose or any particular genre but also by the writer's sense of his or her personal relationship with readers (Hyland, 2005a, 2005b). Regarding personal relationship with readers, Hyland (2005a) maintained that:

“deciding whether to establish an equal or hierarchical affiliation, adopt an involved or remote stance, or choose a convivial or indifferent interpersonal tenor, we are at least partly constrained by the dominant ideologies of our

institutions. But these choices also depend to some extent on the number of intended readers and how far they are personally known to us” (p. 13).

According to Brown and Levinson (1987) writers consider three elements to evaluate their audience: 1) the social distance, 2) the power difference and 3) the scale of imposition being made on the reader. Therefore, writers are required to weigh up these variables to make a conscious decision about how far they can be direct, involved, informal, friendly or forceful. MD is the way the writers do this by drawing on interactive and interactional resources. Interactive dimension of MD has been left out of the focus of this study.

In recent years, there has been a burgeoning interest in the interactional aspect of academic writing. It emphasizes the role of writer in sustaining the level of personality in a text, expressing attitudes, evaluating the ideas and arguments, negotiating social relations with audience characterized by the degree of writer’s solidarity with readers and the extent of reader engagement in the text.

Considering the interactional aspect of academic writing, writing is viewed as a communicative action which entails the reader-writer interaction by means of which writers are able to communicate effectively and readers are able to situate arguments.

It seems that interaction is critical in academic writing because it helps writers situate themselves in the text so as to construct their arguments and keep their readers engaged throughout the arguments. In this light, all effective writings require two features: clear stance and appropriate reader engagement. Stance and engagement are two key features of interactional metadiscourse (IMD).

Over the past decade, the use of IMD has been examined in a number of academic genres including research articles (Hyland, 2005b, 2008a, 2008b; McGrath & Kuteeva, 2012), project reports (Hyland, 2005c), research article abstracts (Gillaerts & Van de

Velde, 2010) and textbooks (Marković, 2013). However, "journal author guideline" (JAG) – labeled as "about authors", "guide for authors" or "instructions for submission" – has escaped the notice of genre academics.

JAG as a distinctive genre in academic discourse has clear generic structures. JAG typically appears on the journal's webpage. It normally consists of several sub-headed sections written in a direct, acceptable style for contributors. JAG is a document with the informational purposes to provide authors with relevant information about journal's policies on the procedures for preparing and submitting a manuscript successfully. In other words, JAG is basically informative since it addresses information about 1) fundamental formatting and style conventions (i.e. the organization of manuscript, typographic conventions, spacing and margins, spelling, quotations, footnotes, tables, figures, graphics, abbreviations 2) nuts and bolts of format and content of each section of paper (e.g. abstract, questions and hypotheses, methodology, result, discussion and conclusion).

All journals have a set of instructions for authors that explicitly explain how their manuscripts should be formatted for submission. Although each journal has its own way of giving the instructions that may differ in the wording format or the order in which information is presented, they work almost in the same way in which they cover the content. The main concern of journal editors is to present the content of JAG in an informative and comprehensible enough fashion to the potential authors with different degrees of expertise. Therefore, not only the content of JAG but the way in which it is presented to the readers would determine how to take action.

Miller (1984) has stated that genres emerge from the basic needs of recurrent rhetorical situations requiring an adequate response. JAG is such a response and by nature a social one. From this point of view, JAG is defined as an interpersonal

relationship between journal editors and submitters. It represents the interpersonal dimension of JAG which is overtly marked. Therefore, one way by means of which journal editors would be able to express their journal's voice and encourage authors to follow directions carefully and make full use of their guideline is the use of IMD. However, it is not clear how journal editors use IMD devices in JAGs to express their stance and establish and maintain relationships with the readers.

1.3 Statement of the Problem

There are considerable occurrences of IMD in JAGs with which, on the one hand, a writer could establish a relationship of mutual understanding with readers, and on the other hand, readers are engaged in a text that provides comprehensible instructions for them on how to prepare their manuscripts for successful submission in a particular journal. While some journals are writer-oriented and highlight the role of editors in expressing their stance in the instructions given to the authors, other journals are basically reader-oriented and try to include essentially readers in the text.

The present study aims to investigate 280 author guidelines developed by the seven most leading international publishers in eight disciplines to determine which journals find themselves successful in communicating with authors and getting them completely involved in the instructions given in author guidelines: reader-oriented (engagement features) or writer-oriented (stance features) journals or those which keep in equal both features, and to pinpoint the reasons behind their success. However, to achieve goals, journal editors are required to pay equal attention to both their stance to convey explicitly their intentionality in the text and their readers' engagement to manipulate them throughout the text more easily.

According to what will be reviewed in the literature, no study has investigated the role of stance and engagement in JAGs. Therefore, the present study intends to shed light on the ways the journal editors interact with their contributors through IMD and help them improve their understanding of the genre.

Since the aim of the present study is to uncover the types, frequencies and functions of stance and engagement markers used in JAGs, these resources and their conceptualizations are limited based on Fu's (2012) model of IMD, who integrated Hyland's two models (2005a, 2005b) and proposed a taxonomy of IMD which includes two broad categories: stance features and engagement features. Stance features including hedges, boosters, attitude markers and self-mentions are related to constructing an image of the writer in the text whereas engagement features including reader-inclusive pronouns, directives and questions are used to involve the reader in the text.

Moreover, this study aims to make a distinction between micro-interactional (MIIMD) and macro-interactional metadiscourse (MAIMD). MIMD markers are identified by hedges and boosters and MAIMD markers refer to self-mentions and reader-inclusive pronouns based on Fu' (2012) classification of MIIMD and MAIMD.

1.4 Objectives of the Study

The overall aim of the study is to collect information on the use of IMD in JAGs. Within this broad theme, the research has a number of specific objectives. The primary objective of this study is to identify the types, frequencies and functions of stance and engagement markers in JAGs. The second objective is to compare the actual differences between stance and engagement features in relation to the variation in the
